Problem 1: Write a program that prints a simple chessboard. **Input format:** The first line contains the number of inputs T. The lines after that contain a different value for size of the chessboard **Output format:** Print a chessboard of dimensions size * size. Print W for white spaces and B for black spaces. Sample Input: 2 3 5 **Sample Output: WBW BWB WBW WBWBW BWBWB**

Problem 2:
_Let's print a chessboard!
Write a program that takes input:
The first line contains T, the number of test cases
Each test case contains an integer N and also the starting character of the chessboard
Output Format
Print the chessboard as per the given examples
Sample Input:
2
2 W
3 B
Sample Output:
WB
BW
BWB
WBW

Code:

```
#include<stdio.h>

Problem 3: Decode the logic and print the Pattern that corresponds to given input. If N= 3 then pattern will be: 10203010011012 **4050809 ****607 If N= 4, then pattern will be: 1020304017018019020 **50607014015016 ****809012013 *****10011 **Constraints:** 2 <= N <= 100 **Input Format** First line contains T, the number of test cases, each test case contains a single integer N **Output Format**

First line print Case #i where i is the test case number, In the subsequent line, print the

pattern
